RISC's first cohesion report examines the composition of social circles of acquaintances in Germany

The first cohesion report by the Research Institute for Social Cohesion (RISC) shows that large sections of the population in Germany have homogeneous circles of acquaintances - and this also influences their world views and experiences. According to the report, the strongest tendency towards network segregation is found among AfD and Die Grünen voters, as well as among highly educated, Muslim and rural population groups. The report is the result of a representative longitudinal study with more than 12,000 respondents. The report focuses on the connection between homogeneous circles of acquaintances and ideals of social coexistence, attitudes towards democracy, experiences of cohesion in the living environment and emotions towards other social groups. [Protest Dynamics in Germany](#)

Project form Prof. Haunss publishes new data platform

Who protests when, where and about what issue? While election results and population surveys are widely available, this is usually not the case for data on protest dynamics in Germany. Yet valid scientific information on who protests, when, on what issues and with which means is of crucial importance for journalists, civil society and the interested public in order to be able to understand current protest events. [Read more ...](#)
