

## Gender relations and occupational sex segregation in Europe

### Overview

European countries face major challenges as regards ensuring equal opportunities for women offered by the EU especially in decision-making processes. Women are mostly located in low-wage employment and rarely in high-wage employment, i.e. in higher and highest positions in the economy. Over the next few years, the aim will not only be to sustainably increase the percentage of women in management but also to secure equal opportunities between women in the higher and lower end of the salary distribution.

### Duration:

01 January 2009 - 31 December 2016

### Details

#### A Cross-National Variety of Vertical Occupational Sex Segregation

In this project we identify the determinants of cross-national variation in women's chances of being in a high-status occupation. Results indicate that in general a large service sector and a high trade union density enhance women's chances of being in high-status occupations, while more specifically a large public sector helps to reduce channelling women into low-wage employment.

#### Does the welfare state support women along the occupational ladder?

Little is known so far on outcomes of policies aiming at gender equality on the one hand and promoting an adult worker model on the other in comparative perspective along the occupational hierarchy. This project estimates the impact of work, family and gender equality policies on vertical occupational sex segregation.

#### From wage regulation to wage gap?

This project focuses on the impact of industrial relations and industry differences on gender wage

differences. Findings from an international comparison suggest that country patterns seem to be due to the overall influence of trade unions and the relationship between pay bargaining strategies and specific minimum wage policies.

### **Does tertiary education pay off? Gender specific earnings and returns on higher education in health care occupations**

Throughout the last decades the German health sector saw substantive inroads of women in the male-dominated medical profession and a slight increase of personnel with tertiary education in the so far feminized and semi-professional occupations of nursing and elderly care. Effects of these trends on the income levels for the male and female employees in the expanding health sector are still under-researched. Results show for all three occupations that women earn significantly less and get less return on education. The gender gap is less pronounced among the profession of doctors than the semi-professional occupation of nurses. The occupational field of elderly care stands out with low wage levels for both men and women but comparatively high returns on education for male jobholders.

**Duration:**
